

DATA ANALYSIS REPORT

Determinants of Male Involvement in Family Planning Among Male Civil Servants in Selected Government Parastatals in Osun State

Executive Summary

This report presents the statistical analysis and interpretation of data collected on the determinants of male involvement in family planning among male civil servants in selected government parastatals in Osun State.

The analysis examined respondents' demographic characteristics, level of involvement in family planning, factors influencing participation, willingness to promote family planning, and hypotheses testing using Chi-Square statistical analysis.

A total of **202 respondents** participated in the study. Findings revealed that a large proportion of respondents demonstrated low involvement in family planning activities. Cultural beliefs and fear were identified as the major influencing factors affecting male participation.

Additionally, hypothesis testing showed that:

- There is no statistically significant relationship between awareness of family planning methods and educational status.
 - There is no statistically significant relationship between male involvement in family planning and religion.
-

1. Introduction

Family planning plays a critical role in improving reproductive health, reducing maternal and child mortality, and promoting family wellbeing. Traditionally, family planning programs have focused more on women, with limited attention given to male participation.

However, male involvement is essential for successful family planning adoption and sustainability. Men often influence reproductive decisions within families and communities.

This study investigates the determinants of male involvement in family planning among male civil servants in selected government parastatals in Osun State.

2. Objectives of the Study

The objectives of this study are to:

1. Determine the level of male involvement in family planning.
 2. Identify factors influencing male involvement in family planning.
 3. Assess the readiness of male civil servants to accept and promote family planning.
 4. Examine the relationship between awareness of family planning methods and educational status.
 5. Determine whether religion influences male involvement in family planning.
-

3. Methodology

3.1 Research Design

The study adopted a quantitative research design using survey questionnaires administered to respondents.

3.2 Sample Size

A total of **202 valid respondents** participated in the study.

3.3 Statistical Tools Used

The data were analyzed using:

- Descriptive Statistics
- Frequency Distribution Tables
- Crosstabulation Analysis
- Pearson Chi-Square Test

The Chi-Square test was used to determine whether significant relationships existed between selected variables.

Decision Rule

- If $p\text{-value} < 0.05 \rightarrow$ Reject the null hypothesis.
 - If $p\text{-value} > 0.05 \rightarrow$ Fail to reject the null hypothesis.
-

4. Demographic Characteristics of Respondents

4.1 Age Distribution

Age Group	Frequency	Percentage
20–30 years	103	51.0%
31–40 years	38	18.8%
41–50 years	41	20.3%
51–60 years	20	9.9%
Total	202	100.0%

Interpretation

The majority of respondents (51.0%) were within the age range of 20–30 years, indicating that younger civil servants formed the largest proportion of the study participants.

4.2 Marital Status

Marital Status	Frequency	Percentage
Single	118	58.4%
Married	76	37.6%
Divorced	4	2.0%
Widow	4	2.0%
Total	202	100.0%

Interpretation

Most respondents were single (58.4%), while 37.6% were married.

4.3 Educational Qualification

Educational Qualification	Frequency	Percentage
SSCE	9	4.5%
OND/NCE	28	13.9%
HND/BSc	131	64.9%
PGD/MSc	34	16.8%
Total	202	100.0%

Interpretation

The majority of respondents (64.9%) possessed HND/BSc qualifications, indicating that most respondents were well educated.

4.4 Religion

Religion	Frequency	Percentage
Islamic	55	27.2%
Christianity	142	70.3%
Traditional	5	2.5%
Total	202	100.0%

Interpretation

Most respondents were Christians (70.3%), followed by Muslims (27.2%).

5. Research Questions Analysis

5.1 Level of Male Involvement in Family Planning

Level of Involvement	Frequency	Percentage
High	54	26.7%

Level of Involvement	Frequency	Percentage
Average	52	25.7%
Low	96	47.5%
Total	202	100.0%

Interpretation

The findings revealed that nearly half of the respondents (47.5%) demonstrated low involvement in family planning activities.

This suggests inadequate male participation in family planning among civil servants in the study area.

5.2 Factors Influencing Male Involvement in Family Planning

Factors	Frequency	Percentage
Culture	102	50.5%
Fear	100	49.5%
Total	202	100.0%

Interpretation

The major factors influencing male involvement in family planning were:

- Cultural beliefs (50.5%)
- Fear and misconceptions (49.5%)

These findings indicate that sociocultural barriers and fear significantly affect male participation in family planning.

5.3 Readiness to Promote Family Planning

Response	Frequency	Percentage
Willing to Promote	66	32.7%
Ready to Attend Workshops	89	44.1%

Response	Frequency	Percentage
Willing to Recommend	47	23.3%
Total	202	100.0%

Interpretation

A considerable number of respondents expressed readiness to support family planning initiatives.

The majority (44.1%) indicated willingness to attend workshops and awareness programs on family planning.

6. Hypotheses Testing

Hypothesis I

Statement of Hypothesis

- **H₀:** There is no significant relationship between awareness of available family planning methods and educational status of male civil servants in Osun State.

Crosstab Summary

Awareness	SSCE	OND/NCE	HND/BSc	PGD/MSc	Total
Not Aware	6	16	81	20	123
Aware	3	12	50	14	79
Total	9	28	131	34	202

Chi-Square Result

Test	Value	df	p-value
Pearson Chi-Square	0.401	3	0.940

Decision

Since the p-value (0.940) is greater than 0.05, the null hypothesis is accepted.

Interpretation

There is no statistically significant relationship between awareness of family planning methods and educational status.

This implies that educational qualification does not significantly influence awareness of family planning methods among respondents.

Hypothesis II

Statement of Hypothesis

- **H₀:** There is no significant relationship between male involvement in family planning and religion among male civil servants in Osun State.

Crosstab Summary

Involvement	Islamic	Christianity	Traditional	Total
Not Involved	43	113	4	160
Involved	12	29	1	42
Total	55	142	5	202

Chi-Square Result

Test	Value	df	p-value
Pearson Chi-Square	0.049	2	0.976

Decision

Since the p-value (0.976) is greater than 0.05, the null hypothesis is accepted.

Interpretation

There is no statistically significant relationship between religion and male involvement in family planning.

This suggests that religious affiliation does not significantly affect respondents' involvement in family planning.

7. Discussion of Findings

The findings of this study indicate that male involvement in family planning among civil servants in Osun State remains relatively low.

Although many respondents demonstrated willingness to attend workshops and promote family planning initiatives, cultural beliefs and fear continue to serve as major barriers.

The hypothesis testing further revealed that:

- Educational status does not significantly determine awareness of family planning methods.
- Religion does not significantly influence male involvement in family planning.

These findings suggest that other factors beyond religion and education may contribute more strongly to male participation in family planning.

8. Conclusion

The study concludes that male involvement in family planning among civil servants in Osun State is generally low.

Cultural beliefs and fear were identified as major determinants affecting male participation.

Furthermore:

- Educational status does not significantly influence awareness of family planning methods.
- Religion does not significantly influence male involvement in family planning.

The findings highlight the need for targeted awareness campaigns and intervention programs aimed at increasing male participation in reproductive health matters.

9. Recommendations

Based on the findings of the study, the following recommendations are proposed:

1. **Public Sensitization Programs:** Government and health agencies should organize awareness campaigns to educate men on the importance of family planning.
2. **Community Engagement:** Traditional and community leaders should be involved in promoting positive attitudes toward family planning.

3. **Male-Focused Workshops:** Workshops and seminars should be organized specifically for men to address myths, fears, and misconceptions.
 4. **Policy Support:** Government institutions should integrate male involvement strategies into reproductive health policies.
 5. **Counseling Services:** Counseling services should be strengthened to provide adequate support and information to men regarding family planning.
-

10. Statistical Summary Table

Variable Tested	Chi-Square Value	df	p-value	Decision
Awareness vs Educational Status	0.401	3	0.940	Not Significant
Involvement vs Religion	0.049	2	0.976	Not Significant

11. Appendix

Statistical Technique Used

Pearson Chi-Square Test

The Pearson Chi-Square Test of Independence is a statistical method used to determine whether a significant relationship exists between two categorical variables.

The test compares observed frequencies with expected frequencies to establish whether differences occur by chance.

Significance Level

The study adopted a significance level of:

- $\alpha = 0.05$

Any p-value greater than 0.05 indicates that no statistically significant relationship exists between the variables tested.

Prepared Data Analysis Report

Software Used: SPSS

Total Respondents: 202

Analysis Methods: Frequency Distribution, Crosstabulation, and Pearson Chi-Square Test
