

EMPLOYEE DIVERSITY, INCLUSION & ORGANIZATIONAL PERFORMANCE ANALYSIS

Employee Data Analysis Report

Analysis based on 75 valid employee responses

Overview

This report examines employee perceptions of workforce diversity, inclusion practices, organizational performance, equity, belongingness and psychological safety, and translates the findings into practical management actions.

1. Executive Summary

The analysis covers 75 valid employee responses measured primarily on a five-point agreement scale. Overall perceptions are positive across the four main dimensions: Workforce Diversity (4.08/5), Inclusion Practices (4.08/5), Organizational Performance (4.18/5), and Relationship Assessment (4.08/5).

The strongest statistical finding is the positive relationship between Inclusion Practices and Organizational Performance ($r = 0.606$, $p < 0.001$). This indicates that respondents who report stronger inclusion practices also tend to report stronger perceptions of organizational performance.

The item-level results identify two areas that require particular attention: equal employment opportunities for people with disabilities and employee involvement in decision-making. Gender and age do not show statistically significant differences in perceived performance within this dataset.

Key Findings

- Inclusion Practices: 4.08/5.
- Organizational Performance: 4.18/5.
- Inclusion $\rightarrow$ Performance: $r = 0.606$, $p < 0.001$.
- Disability employment opportunity: 3.29/5.
- Employee involvement in decision-making: 3.76/5.

2. Objectives

- Identify the diversity and inclusion practices experienced by employees.
- Examine how fairness, psychological safety, belongingness and organizational support relate to perceived employee performance.
- Assess whether perceived organizational performance differs across gender and age groups.
- Measure the relationship between equity, belongingness, psychological safety and perceived organizational performance.
- Translate the findings into practical management priorities that can support a more inclusive and higher-performing workplace.

3. Data & Analytical Method

The dataset contains 75 valid responses. Responses were coded on a five-point agreement scale from 1 (Strongly Disagree) to 5 (Strongly Agree). The workflow included data cleaning, score construction, descriptive statistics, item-level analysis, reliability assessment, Pearson correlation, one-way ANOVA, demographic profiling and aggregation of open-ended responses into non-identifying themes.

Microsoft Excel was used for data preparation and statistical analysis, while Power BI was used to present the findings in dashboard form. Correlation results are interpreted as associations and do not by themselves establish causation.

4. Dashboard

Executive dashboard showing the principal findings.

5. Results

5.1 Average Scores by Analytical Area

Analytical Area	Mean	Median	Std. Dev.	Score ≥ 4
Workforce Diversity	4.08	4.11	0.38	66.7%
Inclusion Practices	4.08	4.00	0.46	65.3%
Organizational Performance	4.18	4.27	0.41	76.0%
Relationship Assessment	4.08	4.00	0.39	69.3%

Organizational Performance records the highest average score (4.18), followed closely by Workforce Diversity, Inclusion Practices and Relationship Assessment. The close range of scores indicates broadly positive perceptions across the main dimensions.

5.2 Lowest-Scoring Items

Item	Area	Mean	Agree / Strongly Agree
DIV08: People with disabilities are given equal employment opportunities at the bank.	Workforce Diversity	3.29	52.0%
PERF01: Employees are involved in decision-making processes that affect their work.	Organizational Performance	3.76	72.0%

INC01: Diversity is visibly promoted and celebrated within the organization.	Inclusion Practices	3.88	78.7%
INC06: I feel comfortable expressing my opinions and ideas at work without fear of judgment.	Inclusion Practices	3.92	78.7%
REL04: The banks commitment to diversity and inclusion has positively affected customer relationships.	Relationship Assessment	3.95	80.0%

Equal employment opportunities for people with disabilities is the lowest-scoring item at 3.29/5. Employee involvement in decision-making follows at 3.76/5. These results identify specific gaps within an otherwise positive overall pattern.

6. Statistical Analysis

6.1 Correlation Analysis

Relationship	Pearson r	p-value	Interpretation
Inclusion Practices vs Organizational Performance	0.606	<0.001	Positive, statistically significant
Equity/Belongingness/Safety vs Organizational Performance	0.589	<0.001	Positive, statistically significant
Workforce Diversity vs Organizational Performance	0.469	<0.001	Positive, statistically significant

Inclusion Practices have the strongest relationship with Organizational Performance ($r = 0.606$, $p < 0.001$). Relationship Assessment, which captures equity, belongingness and psychological safety, is also positively related to performance ($r = 0.589$, $p < 0.001$). Workforce Diversity is positively related to performance as well ($r = 0.469$, $p < 0.001$).

6.2 Demographic Differences

Factor	F-statistic	p-value	Decision
Gender	0.170	0.681	No significant difference
Age	0.334	0.801	No significant difference

Perceived organizational performance does not differ significantly by gender ($p = 0.681$) or age ($p = 0.801$) in the current dataset.

6.3 Reliability

Scale	Items	Cronbach's Alpha
Workforce Diversity	9	0.459
Inclusion Practices	10	0.767
Organizational Performance	11	0.737
Relationship Assessment	7	0.517
Overall 37-item instrument	37	0.864

The overall 37-item scale has strong internal consistency ($\alpha = 0.864$). Inclusion Practices ($\alpha = 0.767$) and Organizational Performance ($\alpha = 0.737$) also show good internal consistency. Workforce Diversity and Relationship Assessment have lower alpha values and are best interpreted alongside their item-level patterns.

7. Discussion of Results

The findings show a generally positive employee experience across diversity, inclusion and organizational performance. Employees tend to agree that the organization demonstrates inclusive practices and performs well. The similarity of the average scores suggests that these dimensions are connected within the employee experience.

The strongest relationship is between Inclusion Practices and Organizational Performance. The positive coefficient indicates that stronger inclusion perceptions are associated with stronger performance perceptions. Inclusion should therefore be treated as part of organizational effectiveness rather than as a separate workplace initiative.

The positive relationship involving equity, belongingness and psychological safety further highlights the importance of the employee experience. Employees who feel respected, supported and safe to express themselves may be better positioned to participate, communicate concerns, collaborate and contribute.

The disability inclusion result deserves particular attention. Although the overall diversity score is positive, the disability-related item is substantially lower. This indicates that a strong overall diversity score can conceal gaps affecting specific employee groups.

Employee involvement in decision-making is the second major gap. A mean of 3.76 remains positive, but it is lower than most other items. This suggests an opportunity to strengthen employee voice through structured feedback and clearer communication about how employee input is considered.

The absence of statistically significant gender and age differences indicates that perceived performance is relatively consistent across these categories in this dataset. Continued measurement remains important because differences may emerge across other workforce segments or over time.

8. Recommendations

1. Prioritize disability inclusion. Review recruitment, accessibility, workplace adjustments and equal-opportunity processes. Establish measurable indicators for progress.
2. Increase employee participation in decision-making. Strengthen departmental feedback channels, staff consultative groups, listening sessions and feedback loops showing how employee input affects decisions.
3. Strengthen psychological safety. Maintain safe channels for raising concerns and encourage leadership behaviours that allow employees to express ideas without fear of judgment or retaliation.
4. Increase visibility of inclusion practices. Communicate commitments through leadership messages, internal communication, recognition activities and periodic reporting of progress.
5. Monitor inclusion and performance together. Repeat the measurement periodically and track inclusion indicators alongside performance perceptions to identify changes over time.
6. Manage by specific indicators. Use item-level findings to target interventions instead of relying only on one overall diversity or inclusion score.

9. Conclusion

The analysis shows broadly positive employee perceptions of diversity, inclusion and organizational performance. The strongest finding is the significant positive relationship between inclusion practices and perceived organizational performance, supported by positive relationships involving equity, belongingness, psychological safety and workforce diversity.

The clearest improvement opportunities are disability inclusion and employee involvement in decision-making. Addressing these areas while maintaining existing strengths can support a more consistent employee experience and strengthen the organizational conditions associated with positive performance perceptions.

10. Key Metrics

Metric	Result
Responses	75
Workforce Diversity Mean	4.08/5
Inclusion Practices Mean	4.08/5
Organizational Performance Mean	4.18/5
Relationship Assessment Mean	4.08/5
Strongest relationship	Inclusion → Performance: $r = 0.606$, $p < 0.001$
Lowest item	Disability employment opportunity: 3.29/5
Second-lowest item	Employee decision-making involvement: 3.76/5
